

with 10 years of experience leveraging advanced analytics, Qlik Sense, and Tableau to optimize complex enterprise datasets. Proven track record of building predictive models, optimizing data pipelines on AWS and Azure, and driving strategic insights through Power BI dashboards. Adept at implementing CI/CD pipelines and IaC to automate continuous model deployment and monitoring.

Qlik Sense | Tableau | AWS | Azure

Microsoft Certified: Azure Fundamentals.  
Artificial Intelligence Foundations: Machine Learning  
Data Science and Machine Learning with Python.

Qlik Sense | Tableau

**K 4 Q**  
*Led strategic data science and GenAI initiatives that elevated credit-risk decisioning and automated complex document analysis. Core responsibilities included developing predictive models across multi-million record datasets, implementing RAG architectures for instant financial insight extraction, and serving scalable REST APIs in cloud environments.*

Designed end-to-end solutions integrating LLaMA and Azure OpenAI with Azure AI Search, engineering AutoGen agents and NLP pipelines (tokenization, lemmatization, embeddings) to streamline financial query resolution and cut analysis time by 40%.

Partnered with risk and fraud teams to construct credit-risk classification models using XGBoost and gradient boosting, applying hypothesis testing, confidence intervals, and regression analysis across 3M+ records to improve detection accuracy by 25%.

Built Qlik Sense dashboards over transaction narratives and customer behavior (tokenization, lemmatization, embeddings) to make customer segmentation noticeably sharper.

Developed real-time Qlik Sense dashboards powered by SQL and pandas pipelines to present executive metrics, driving a 30% gain in decision-making efficiency.

Deployed models to production as containerized services with Docker, served through Flask and SvelteKit on AWS and Azure.

Integrated LLaMA and Azure OpenAI models with a RAG setup and Azure AI Search for document context, and built AutoGen agents to handle routine financial queries.

**Q** **!**  
**4 4 - K 4 7**

*Spearheaded large-scale predictive analytics across multi-terabyte claims datasets to elevate CMS Star Ratings and clinical outcomes. Bridged data engineering and data science by building PySpark pipelines in Azure Databricks, alongside deploying secure, HIPAA-compliant NLP models via Kubernetes and MLflow MLOps frameworks.*

Fine-tuned transformer-based QLoRA architectures and automated Named Entity Recognition (NER) models to extract clinical entities from unstructured EHR notes while masking PHI/PII data to enforce strict HIPAA compliance.

Built and optimized machine learning algorithms using Qlik Sense, Tableau, and SQL to predict patient disease progression, emergency department utilization, and hospital readmission probabilities.

Designed advanced ML pipelines to predict patient risk trajectories, packaging the finalized models into Docker containers to achieve secure, low-latency scoring.

Constructed enterprise data processing pipelines within AWS using PySpark and Delta Lake to cleanse, transform, and aggregate raw clinical and administrative claims datasets.

Managed model training and batch inference pipelines on AWS utilizing transformations, and Amazon Redshift as the underlying data warehouse. Built custom visual dashboards for clinical managers to monitor HEDIS metrics and CMS Star Rating indicators. Established capabilities using MLflow to log parameters, track model drift, and automate continuous integration and deployment Utilized to schedule, orchestrate, and monitor daily processing jobs across distributed cloud storage environments.

Q K

---

Built an NLP solution on LLaMA-based models to extract and summarize insights from unstructured financial documents in real time, with prompt engineering tuned to financial terminology. Wired outputs through Flask APIs and AWS RDS straight into Power BI dashboards; cut analysis time by about 40%.

Q

- Engineered an automated pipeline to continuously monitor production data pipelines for quality issues (nulls, schema drift, outliers), flagging anomalies for rapid triage.
- Reduced mean time-to-detection for data pipeline issues by surfacing automated alerts and visualizations for on-call engineers.
